## Annual Report, 2004-2005

### **Job II-A: Kill Studies of Deer on Alabama Wildlife Management Areas**

Study Leader: Christopher W. Cook

**Objective:** To measure, record, and evaluate the deer harvest on Alabama Wildlife Management Areas.

**Procedures:** Project personnel recorded hunter participation and success on each of the 35 wildlife management areas (WMAs) having deer hunting during the 2004-05 season. Deer were examined and records were made of their sex, age, weight, and antler development. Portions of this information were computed by project cooperators and submitted to the project leader.

### **Discussion:**

#### **Hunter Participation and Success:**

The number of deer harvested on each management area, the hunting method, and the man-days of participation are compared in Table I. The figures in Tables I through VIII are considered estimates since season permits are issued on many of the areas. Hunter participation and success may vary due to weather, date of hunt, and length of the season. To better understand overall trends, Tables II through VI compare this past season's participation and success with an average of prior years, as well as last year.

Participation in stalk hunts decreased by over 14,700 man-days from last year's totals. Twenty-two of the 27 WMAs offering stalk hunts had decreases in hunter man-days for those hunts. Hunter success improved, dropping from 26 man-days

per deer harvested in 2003-04 to 20 man-days per deer harvested in 2004-05. This success rate was better than the average of 23 man-days per deer harvested for the period of 1998-2003 (Table II).

Eighteen WMAs scheduled either-sex deer hunts for youth hunters during the 2004-05 hunting season. Each hunter participating on one of these special hunts had to be less than 16 years of age and had to be accompanied by a non-hunting, licensed adult 25 years of age or older. Total participation on these hunts decreased from last year's total of 1,507 hunters to 1,096 hunters for 2004-05. The decrease probably resulted from the opening of an early statewide youth deer hunting day in Alabama on the Saturday preceding opening day of the general gun deer season. In the past, the WMAs were the only areas in Alabama with special early youth deer hunts. Other hunting opportunities resulted in less hunter participation during these hunts on the WMAs. The harvest on these hunts also decreased, dropping from 131 deer in 2003-04 to 51 deer for 2004-05. These totals (hunters and deer harvested) are included in the stalk hunt totals in the following tables. The numbers for these hunts also are listed in Table II-A. The primary purpose of the youth hunts is to acquaint young hunters with deer hunting. These hunts will continue on WMAs where there is sufficient interest.

Twenty-two WMAs had a total of 132 hunter's choice draw hunts (Table II-A). One hundred thirty-one of the 132 hunter's choice hunts were stalk hunts and one hunt was a dog hunt. A percentage of permits on these hunts are hunter's choice. The percentage of hunter's choice permits available to hunters ranged from 50% to 100%, depending on the anticipated antlerless deer harvest. The opportunity to harvest antlerless deer on the hunter's choice draw hunts greatly influences the participation, harvest, and hunter success levels shown in the stalk hunt totals. Participation in hunter's choice draw stalk hunts was 40% of the total stalk hunting effort and represented 57% of the total stalk harvest. The hunter success rate for the hunter's choice draw stalk hunts was one deer per 14 man-days of hunter effort,

which was two times higher than the success rate for the bucks only stalk hunts (one deer per 28 man-days of effort). Fifty-nine percent of the harvest from the hunter's choice draw hunts were antlerless deer.

Participation in managed dog hunts decreased from the 2003-04 totals (Table III). Hunter success also decreased from last year's 29 man-days of hunting per deer killed to 31 man-days of hunter per deer killed for the 2004-05 hunting season. Dog hunting participation was 4% of the total deer hunting effort on WMAs during the 2004-05 season and accounted for 3% of the total harvest.

Archery hunting participation decreased slightly (30,089 man-days) from last year's totals (30,136 man-days). Hunter success increased from the 2003-04 season, with individual man-days per deer harvested dropping from 35 to 20 (Table IV). Most of this increase is due to the change in how deer kill is calculated on the WMAs. Archery harvest was reported using estimated deer killed on all WMAs for the 2004-05 hunting season. This is a change from previous years when reports from some WMAs used known deer killed, while others used estimated deer killed. The change makes comparisons of deer kill and hunter success rates between and among WMAs for the 2004-05 hunting season more equitable, but makes comparisons with previous years' data difficult. Archery hunting continues to provide a large portion of the hunting recreation on WMAs, representing 31% of the total deer hunting effort and 31% of the total deer harvest.

Participation in primitive weapons (PW) hunts during the 2004-05 season decreased by nearly 1,300 man-days from the 2003-04 totals. The success rate on PW hunts increased, going from 28 man-days per deer harvested during the 2003-04 season to 18 man-days per deer harvested for 2004-05 (Table V). Participation on PW hunts represented 5% of the total deer hunting effort and 5% of the total deer harvested on WMAs for the 2004-05 season.

The total hunting effort, as shown in Table VI, showed a major decrease of just over 16,800 man-days from the 2003-04 totals. This was the first year since the 2000-01 hunting season that there was a decrease in the total deer hunting effort on WMAs. This year's hunting effort was slightly less than 1,500 man-days less than the average from the previous five years (1998-99 through 2002-03). This year's hunter success ratio of one deer harvested per 20 man-days of effort for all deer hunts was lower than last year's (28 man-days per harvest) and the average for the previous five years (24 man-days per harvest).

#### Hunting Pressure and Kill Per Square Mile:

Total man-days of deer hunting per square mile, as shown in Table VII, was highest on St. Clair, Barbour, Little River, Autauga, West Jefferson, and J. D. Martin-Skyline WMAs and lowest on Seven Mile Island (archery only), W. L. Holland and Mobile-Tensaw Delta, Upper Delta, Black Warrior, Coosa, and Cahaba River WMAs, respectively. Stalk hunting made up the largest portion of total use per square mile on nearly all areas (24 of 30), archery hunts made up the largest portion of use per square mile on Freedom Hills, Blue Spring, the Jackson County Waterfowl Areas (archery only), Swan Creek and Mallard-Fox Creek (archery only), and Seven Mile Island (archery only), and dog hunts made up the largest portion of use on Scotch.

Most areas of Alabama can support a balanced harvest (bucks and does) of ten or more deer per square mile annually, depending on habitat quality. Only two WMAs achieved this level of harvest, mainly because of the limited opportunity to harvest antlerless deer with firearms and low hunting pressure on most WMAs (Table VIII). St. Clair had the highest harvest per square mile with 13.7, followed by Lowndes with 11.6, Blue Spring with 9.0, Barbour with 8.8, and James D. Martin-Skyline with 8.6.

### Weights and Condition of Deer:

Average weights of deer within specific age classes are one of the best indicators of overall herd condition (Table IX). An average live weight under 95 pounds for 1-½ years old males (i.e., yearlings) can be an indicator of poor physical condition caused by insufficient nutrition, either from poor habitat, heavy competition for food from other deer, or both. Where the yearling males have an average body weight of 95 to 105 pounds on areas with good soils, there should be concern the deer population exceeds the capacity of the land to support the herd in good condition. The deer population should be reduced to a more healthy level in any situation where competition for food is the cause of low body weights in deer. Areas in Alabama with yearling males averaging above 110 pounds live weight usually are not carrying an excess of deer and efforts should be made to keep those populations at these levels. Wolf Creek WMA was the only WMA with an average yearling male body weight that exceeded 110 pounds (113 pounds). Thirteen other WMAs reported average yearling male body weights between 100 and 110 pounds. Only one WMA (Frank W. and Rob M. Boykin WMA) had average yearling male body weights of 90 pounds or less. The average weight on this WMA was 85 pounds.

### Antler Development:

Antler development (number of points, main beam length, and inside spread) for all age classes of bucks was very good on some areas, such as Autauga, Barbour, Black Warrior, Cahaba River, Choccolocco, Covington, Freedom Hills, Hollins, Lauderdale, Lowndes, Mulberry Fork, Sam R. Murphy, and Wolf Creek, but remains poor on others (Tables X and X-A). In most situations, a high percentage of spikes in the one-year age class and a significant occurrence of spikes in the older age classes are a reflection of poor habitat conditions and/or an overcrowded population. The heavy harvest of yearling bucks on many WMAs prevents significant numbers of bucks from reaching the older age classes. This alone will

continue to limit the harvest of bucks  $\geq 2\frac{1}{2}$  years old on these WMAs. Corrections to both nutritional deficiencies and buck age structure are necessary in order to bring about improvements in the quality of bucks harvested. However, on areas with poor soil fertility and/or habitat quality, reducing competition for food by reducing deer populations may require the removal of more deer than may be acceptable to many WMA hunters. On very poor quality sites, even a significant reduction in deer numbers may not produce improvements in deer quality. For this reason, some areas may not be suited for this type of management.

Five WMAs were under quality deer management (QDM) guidelines for the 2004-05 hunting season. These included Barbour, Covington, Freedom Hills, Lauderdale, and Lowndes WMAs. On all five of these WMAs, bucks must have at least 3-points on one antler to be legal for harvest and hunters have more opportunity to harvest antlerless deer on gun deer hunts than on most other WMA's. All five WMAs have shown considerable improvements in the age structure of the antlered buck harvest since initiation of the QDM programs. This was the primary reason for implementing the antler restriction. For the 2004-05 hunting season, the overwhelming majority of the reported antlered buck harvest on these two areas was comprised of  $2\frac{1}{2}$  year old and older deer (Barbour 88%, Covington 74%, Freedom Hills 77% Lauderdale 87%, Lowndes 90%). Prior to the implementation of the antler restrictions,  $1\frac{1}{2}$  year olds were the largest age class in the annual buck harvest. The current management strategies on all five areas continues to produce a higher percentage of adult bucks ( $2\frac{1}{2}$  years old and older) in the population, as well as a more balanced adult sex ratio, more intense rutting behavior, and many other traits characteristic of a healthy, balanced deer herd managed under QDM. Biologists on these areas continue to collect biological data, as well as public opinion data, to monitor the status of the deer herd and the hunters using these five WMAs. These data are used to evaluate the effectiveness of current management practices used on the areas and aid biologists in making decisions to help achieve their long-term management objectives. As the public's demand for more WMAs managed for

better quality deer becomes stronger, the Division of Wildlife and Freshwater Fisheries may decide to initiate QDM programs on other public hunting areas in the future. The majority of Alabama's WMAs will continue to be managed for maximum opportunity for buck harvest until that time.

**Remarks:**

Wildlife management areas provide a significant proportion of the deer hunting opportunity in Alabama. This year a 49% sample of the total deer harvest on WMAs was used in Tables IX, X, and X-A. Project cooperators entered check station data on age, sex, weight, and antler development on bucks harvested from WMAs on computer and submitted a copy of these data to the project leader for analysis. Table XI represents the number of male and female deer by age class used in the 49% sample collected from the various management areas. Individual hunt results and district totals are listed in Appendix I. Efforts will continue to improve the accuracy of the tables and to expand our survey when necessary to better manage the resource.

This study was a contribution of the Alabama Division of Wildlife and Freshwater Fisheries supported in part by funding from the Federal Aid in Wildlife Restoration Program, Project W-35, Study 2.
